

PLOTTEAFILES

BUILDING IN PUBLIC — JUNE 2026

I built an AI video factory on my **laptop.**

Script → Voiceover → Captions → Cinematic Images → MP4
Fully automated. All local. All mine.

PLOTTEAFILES

THE CONCEPT

What is PlotTeaFiles Studio?

A **local AI pipeline** that turns a plain story script into a **fully produced short-form video** — with voiceover, captions, and cinematic images — in one click. No team.
No expensive subscription. Just a script and an API key.

2 / 9

PLOTTEAFILES

THE PIPELINE

6 Steps. Fully Automated.

**Script Input**

Paste your story → GPT converts it to structured JSON

**Voiceover**

OpenAI TTS narrates each segment

**Captions**

Whisper transcribes → word-level karaoke captions

**AI Images**

gpt-image-2 generates cinematic 9:16 visuals

**Remotion Render**

React-based engine assembles → exports MP4

**Download Ready**

MP4 saved locally, ready for upload

THE TECH STACK

Everything Stitched Together.

WEB UI

Next.js 16

VIDEO ENGINE

Remotion 4.x

IMAGES

gpt-image-2

VOICEOVER

OpenAI TTS

CAPTIONS

Whisper API

SCRIPT AI

GPT-4o

CLI

Commander.js

LANGUAGE

TypeScript

PLATFORM

Windows 11

SESSION UPGRADES

7 Things We Built in One Day.

1

gpt-image-2 Integration

Upgraded from old model — better quality, High as default

2

Remove Gemini

Free tier too unstable — OpenAI only from now on

3

Model Selector

UI dropdown: gpt-image-2, 1.5, 1 — threaded full stack

4

Progress % + Time Remaining

Live countdown on every job card

5

Terminal Log Piping

Child process output now visible in real-time

6

Caption Overhaul

Purple word highlight, 74px font, tighter phrase window

7

Full UI Redesign

Cinematic dark theme — orange accent, editorial panels

5 / 9

PLOTTEAFILES

REAL TALK

The Walls We Hit (and Broke).

Session context wiped mid-build

Ran git diff HEAD — all 3 upgrades recovered from uncommitted working tree changes

Render stuck at 58% — no logs

Checked /api/jobs directly. Job alive. Fixed by piping child stdout to terminal

fal.ai balance exhausted

FLUX fully coded — parked until funded. Fell back to OpenAI only

Port 3000 EADDRINUSE

netstat found the stale PID. Killed with Stop-Process. Server back in 10 seconds

Gemini free tier unreliable

Not falling back to OpenAI as expected. Removed entirely — simplified the whole stack

6 / 9

PLOTTEAFILES

THE COST

How much does one video cost?

\$0.06per image
gpt-image-1.5 medium**\$0.29**draft video
5 images, 1 shot/segment**~\$2**final quality
gpt-image-2 high, 15 images

Use 1 shot/segment for testing. 2–3 shots for final. You control the cost — down to the model and quality level.

7 / 9

THE ROADMAP

What's Coming Next.

MAJOR

AI Video Generation

Real video clips per segment, not just stills — when budget allows

MAJOR

FLUX Pro (fal.ai)

Fully coded, wired through full stack — blocked by \$0 balance only

MINOR

Quality Default Fix

One-line change — UI default to 'high' to match backend

MINOR

Auto-Start on Boot

pm2 or Windows Task Scheduler — deferred to save RAM for now

PARKED

Stock Video (Pexels)

Rejected — not enough usable content. Need AI video gen instead

PLOTTEAFILES

Script → Video. One Click.

Built from scratch. Rebuilt twice. Every wall knocked down. This is what building in public actually looks like.
